

Time dilation against that of $F=1/T$
($3 \cdot 10^8 \text{ M/s}$)

Albert Einstein, defined and "Stipulated" the conditions of *(the)* "Space ~ Time" constant; a "con-juncture" that **cannot** exist; that of "Space", and "Time" being part of the same constant, given the fact that a "constant" forms a singularity of one and not of one plus one, that is an accumulation thus wrong.

To express the "error" of Mr. E. (Bertie to his friends), it, (the error) can be expressed by the construct of the Hydrogen Atom:

As shown above, "Hydrogen" comprises of the lowest possible component combinations to form one atomic structure, "One" Nuclei and "One" Electron, any other combination would form a "fundamental" **multiple** of ONE.

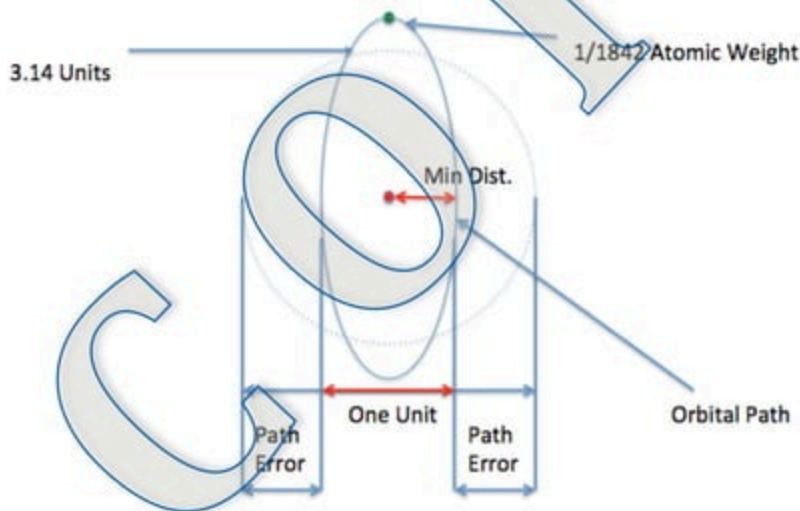

Irrespective of any "**postulated size**", or distance of a presumed mathematical condition, the state of one plus one is the fundamental overriding constant; though to examine the singularity of this construct in isolation is to ignore the sub elements of that construct itself, that of the nuclei, that of the electron, that of its orbital path, that of the velocity of the electron on its orbital path, and, that of its magnetic charge, where to isolate each of the per-cursor events liberates the following: That of Hydrogen's construction itself:

1. One Nuclei who's nominal position in space has to be [0,0,0] of itself, and,
2. One electron that orbits around its nuclei at a give distance from the origin of [0,0,0] of itself.

3. The minimum distance multiplied by two, forms the absolute minimum "space~ial" distance where ANY [TWO] atoms can co-exist.
4. The "orbital" (path~distance) of the electron is exactly 3.14 times that of the minimum distance of the "space~ial" separation of the nuclei to the electron.
5. The electron has a mass or density of 1/1842 part's to that of the nuclei or in layman's terms (it has a PHYSICAL weight).
6. The speed of the electron has been pre-determined by the speed time constant of 3×10^8 meters per second.

Conditions 1 though to 6 must "co-exist", else the atomic structure of hydrogen would fail; and, as if by magic "one" of those very clever people shout's out; *"Only half right, the orbital path of an electron is elongated"*; liberates the ONLY written response, that of:

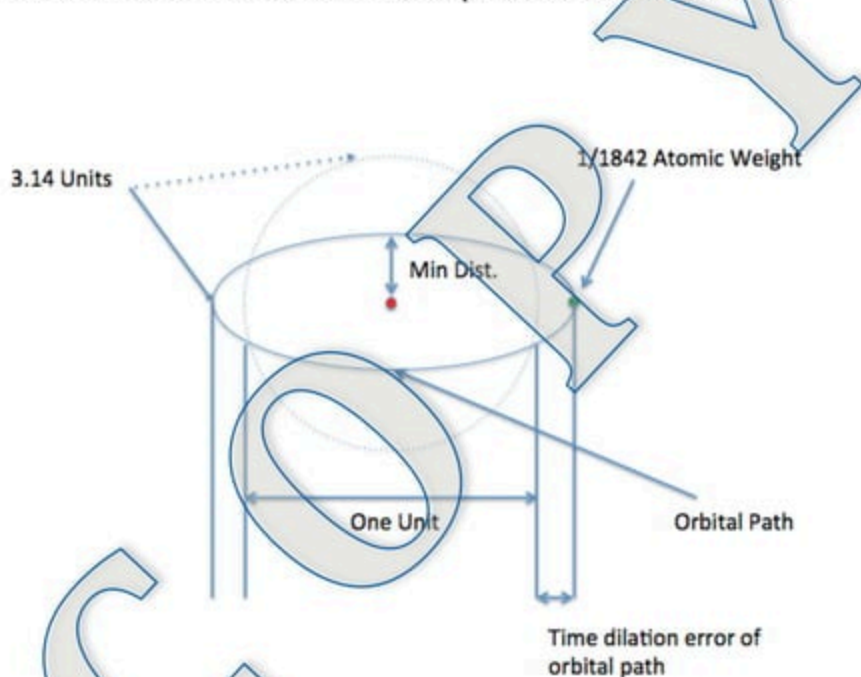

The assimilation of the orbital path to that of an ellipsoid or "elongated hyper parabolic quadratic based on a circle" results in the condition of an "Error Path", or path of infinite correction, where the correction cannot occur at the same time as the error itself and, the correction must therefore occur "next time around", or next step or iterative correction as shown below:

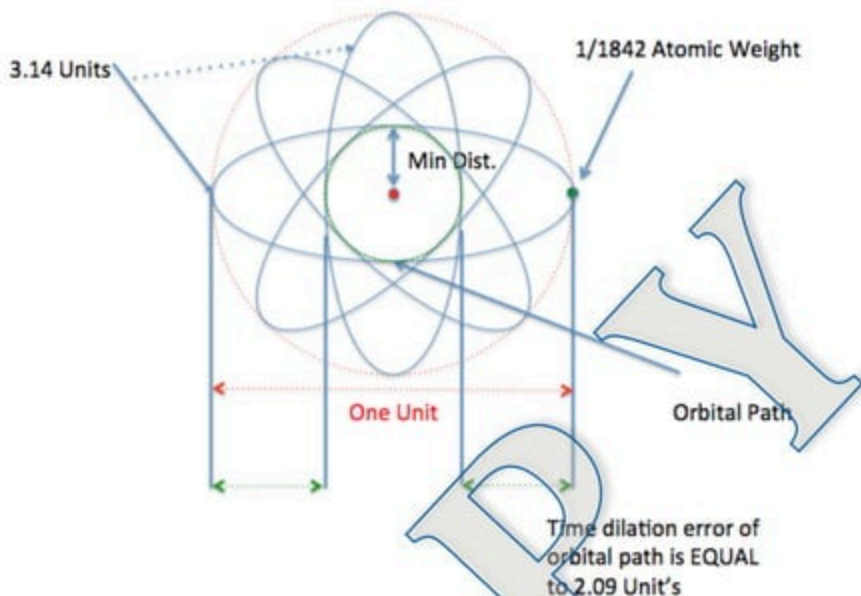

Examining the above condition, that of ellipsoid paths and infinite correction would still produce a point in space of the absolute minimum distance from the nuclei to the electron, though in this condition the speed time constant fails itself; that of

Nigel

3×10^8 M/s being the speed of an electron in a given direction, and it can be seen that for this condition to exist in the above image, (an ellipsoid), would suggest that there must be a speed variation between the x and the y axis's or to express as a time difference up and down verse the time take to go from left to right, (Horizontal Vs. Vertical). Thus an ellipsoid defies the speed time constant, thus must be centroid and not ellipsoid. To remain in an ellipsoid state would cause the atomic structure to "wobble" about its own axis, thus UNSTABLE; where, to attempt "correct" the condition by re-representing the same image in an alternate plane only leads to further confirmation of time dilation of an ellipsoid condition as now shown:

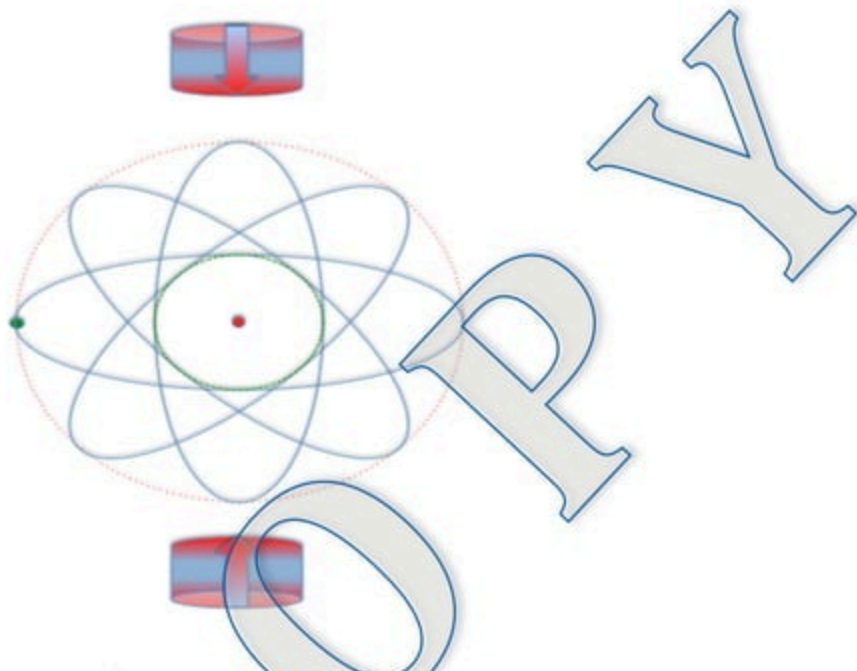

The "conditions" of the "atomic structure" of Hydrogen, ply (the) metric of "one unit", else Hydrogen would not exist, and an ellipsoid path of infinite correction would result in a "wobble" or time dilation error of the orbital path, hence "next pass correction", a state of infinitive and iterative correction; where to continue to accept the postulated speed differential equation resulting in "An Electron being at all points in space at the same time (3×10^8 M/s)" produces the condition of a super imposed spheroidal projection of an infinite path of correction to an ellipsoid condition of the elongation of the path of propagation of the orbital path of the electron, and viewed in its populated condition produces a greater error of correction:

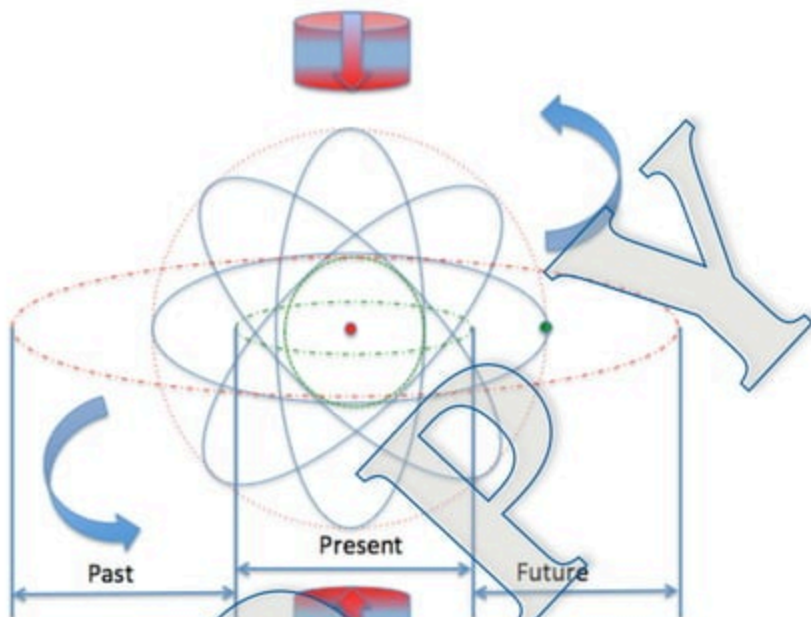

The **minimum** distance is now established as the "iterative accumulated path of correction", and the (nuclei and electron) are also now constrained by it **absolute maximum** condition for the ellipsoid condition of a path of infinite correction by elongation; where the "wobble" can be seen and is represented as TWO PARTS of "Pi" or 2.09 units of the constant defined as the absolute minimum distance within the space~ial representation of the atomic nuclei and the charged electron; thus, (the) 2.09 units of "differential space", is also directly proportional to the **minimum** free space between two atoms to avoid atomic collision, or invading the atomic neutral zone of ionic electron discharge resulting in (a spark); a natural conditional state of one over one or 1/1 (That of the atomic condition of Hydrogen);

Given that the electron holds a "magneto charge" that of a positive condition or to re-represent so that the "clever" one's can understand, it would be a "North" charge (non-conditional). Thus to "constrict" or to "squash" the orbital conditions would result in further amplification of the time dilation of the free space condition as shown below:

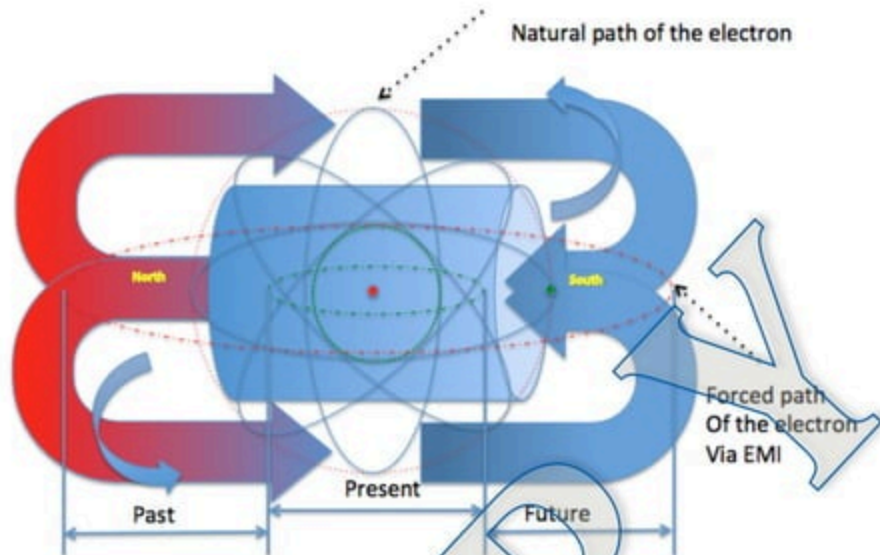

The above represents and utilizes an EMI device to "Magnetically Intensify the electrons" by forcing a conditional state of opposition through a spherical projection resulting in the elongation of the elongated ellipsoid path of the electron.

Given the "view point" in time is the point of origin based around a $[0,0,0]$ condition, a point or location that is neither positive nor negative in any axis of itself, a stationary reference of ZERO; where to extend the condition of the known to a secondary postulated condition that of "Schrodinger's cat" (a state it is or it is not), would lead to time dilation being represented as the conditional state, that of the existence a hydrogen atom at a nominal point of $[0,0,0]$ where the "TIME" of the atomic structure remains ZERO, and movement FORWARD from $[0,0,0]$ would be an INCREASE in the TIME position relative to zero represented as $[1,0,0]$ or $[0,1,0]$ or $[0,0,1]$ or any other condition that results in a positive expression of the positional data of the zero location of one as show below:

The "electron" of the hydrogen atom is forced in to a conditional state that is opposed to the conditional state of the natural position of the electron bound by the absolute minimum distance between the nuclei and the electron; the compression causes a line of compression along the horizontal axis of time. Thus at the nominal point of time, that of [0,0,0] (the center), an elongated ellipsoidal condition occurs resulting in the fact that the electron is now forced into a condition of time dilation, the time to the left of the center point has not yet occurred and the time to the right has occurred before the event at the center; the TWO values exist due to the stipulated and postulate claims of a speed \sim time constant. Thus speed (3×10^8) can not be constant due to ellipsoid movement about a common axis, and time cannot remain constant due to the forced elongation of the time differential it self.

An EMI device utilizes the opposed condition of forced electron migration about a common axis of zero resulting in the forced elongation of the ellipsoidal condition of the neutrality of the hydrogen electron where the resultant condition is a "space~ial" change, a change in the definition of space as a conditional component of Mr. Bertie's differential for space~ial relativity and the former declared "space-time" constant. Thus, as so CLEARLY represented above, space is now a differential, a conditional state and not a constant, thus space becomes the MOVING part of the relativity equation and time becomes totally irrelevant to the position of the electron. Thus the collapse of the time differential of the space time constant.

Extending the above geometry to a size that would "accommodate" something larger, a "human", and, as the EMI does not "physically" touch or interact with the contents at the center of the EMI results in a condition that if a human were to stand in the middle of an EMI device the human would be in the past, the present and the future; all at the same time. Thus to magnetically constrain the possibility of the past and force the past to become a magnetic part of the future results in the human condition of present and "future past"; to quantify the "amount" of "future~past" that is available for the viewing of the human is determined by several ancillary conditions. The amount of magneto compression, the intensity achieved, the cone of elongation and when a secondary EMI is used and configured as a reversal field, time can be seduced to the secondary device. This condition remains constant at a

Nigel

steady state as long as the MSSR is not breached, (the MSSR is the Minimum Self Seduction Range), a point between two cones of constriction, one from each EMI devices.

Having established:

- (1). The minimum possible distance for the electron orbit;
- (2). The maximum possible space~ial differential for the electron orbit;
- (3). The "tipping point" of 2.09:1 of the positional condition of the time differential of atomic structure of Hydrogen;
- (4). The existence of "future past";
- (5). That "space" is the moving part of "space time" relativity and not a constant
- (6). That an EMI draws its power from the magneto polar conditions of the Earth which in turn draws its power for the solar and cosmic conditions of Dark Matter and Dark Energy;
- (7). "Universal polar magneto displacement" results in a condition that an EMI device when correctly configured will be positioned at a point in space of [0,0,0] to ALL space and to ALL of time in relation to itself, an absolute of centrality;
- (8). That the speed constant of 3×10^8 cannot be constant due to ellipsoidal conditions;
- (9). That time is now totally irrelevant to the position and space allocation to the atomic structure of Hydrogen, thus forms the non conditional state that if hydrogen exists in a fundamental state then all other atomic structures exists in the same state;
- (10). The combined result of 1 to 9 breaches each and every condition of "Space-time" Relativity.

When examining the "deconstruction" of the relativity constant referred to as the "Space Time" constant, it can be seen from this very simple document and its "simplified" view, (though simplified to an enormous extent for "clever" people to understand), not only shows, but also represents a more "accurate" representation of the definition of a unit in space, and the function of a time differential that is visible in more than one state, that of the present state of non condition time and its fluctuation of "zero" placed in time at an axis of [0,0,0] about itself; thus creating multiple sub conditions and many "absolute" conditions that MUST exist in order for the most fundamental of atomic structures to exist, that of Hydrogen; Ergo "If Hydrogen (as is) were to be bound to the speed time constant as related to the Relativity Speed Time constant, Hydrogen would rip itself apart, but as it can be seen, Hydrogen exists now it existed then and will exist tomorrow (the future); thus the very existence of Hydrogen confirms each line of this document, (including) each of the designated function's, and the common constant of the GPU (Grand Prime Unit) that of the construction limitations, bounds of confinement and esoteric "Nucleoidal" conditions of One Nuclei and ONE Electron.

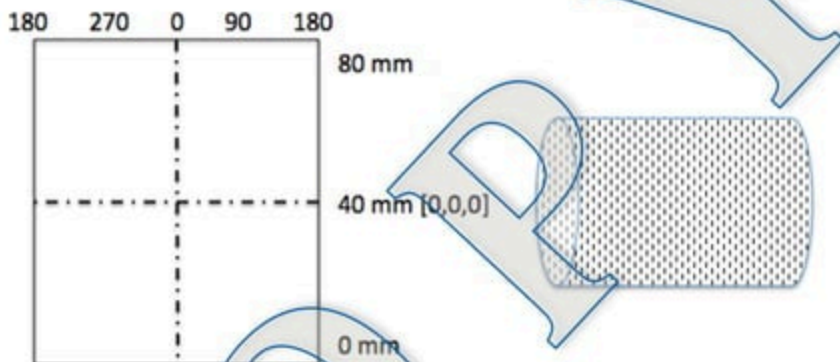

Though to now extend the above to the condition of the "conditional" state of the opposed fields of ultra high resolutions that occur within an EMI, that of a infinite input stream of positive ions which are then compressed within their free space to their absolute "electro magneto state", that of the GPU space tolerance of itself, that of "AIR" (a combination of gases of which the majority is Nitrogen); the ion stream is then "condensed" to a focal point of [0,0,0] about the common axis of [0,0,0] within the core of the EMI where the stream is then focused forward overlaying itself and further condensing to its absolute confined minimum, the stream is then pulled and pushed though the EMI gate to a final focusing cone producing a rotation around its own common axis creating a HIGHLY CHARGED STREAM OF CONDENSED IONS OF CIRCULAR POLARIZATION, a Magneto Laser of enormous proportions, an infinite supply of EM Energy sourced direct from the Earths EM field, which is directly plugged in to the cosmos, (an infinite supply of pure clean energy)

To examine the time dilatation properties of an EMI it is also necessary to examine the conditional state of the source medium, that of the infinite source of the EM energy throughout the universe, all of which is being plumbed directly to ONE side of an EMI, thus at the midpoint of the EMI at an axis of zero, that being [0,0,0] of itself, anything and everything in the form of conducted EM energy extended thought all of time, the EM stream is directly sourced from the Earth, and likewise the Earth sources its EM energy directly from the cosmos, (all of it), going right back in time, all 13.7 billions light years of it, all of time, all of the EM energy is now directly plumbed to a human defined point in time of [0,0,0], though to hold all of time to the left of a common axis of [0,0,0] and to then "project" the said same through an aperture is to "view" what comes next as a stream of EM energy that must stretch forward in time to the same amount of time is the past else the EM fields of 50% ~ 50% Dark Matter Vs. Dark Energy would be imbalanced, this is further confirmed by recent actives with HUBBLE that of the now known electro Magnetic distance of the cosmological background noise relating to a distance of 13.7 billion light years, (unless that condition is false too).

The above alludes to many known properties of common constructs that have being miss represented or deviate from the absolute truth, though investigating the simplicity of Hydrogen and plying the rudimentary of geometry and common logic releases so many "brow" lifting events, it also allows for the release of the fundamental functions of EM to be re-investigated to the full and for mankind as a whole to grasp with both hands their future and to move forward in its existence, rather than to "stagnate" and remain bound to a two dimensional miss representation of a three dimensional condition based around a common axis of zero; thus proving time and time gain, "the greatest amount of power can be found closer to one than any other number", Ergo $E=mc^2$ ply's the need to use an finite amount of energy to reach an infinite point, a fact of an impossibility, thus fails the 1/1 GPU of Hydrogen; thus defines the UNIVERSAL EQUATION: $N1$ of (0.0.0)=1/1 (everything else is a derivative) signifies "much more than this meets the eye", thus

to expand the conditional derivate of time requires that an EMI be viewed as a Cartesian surface with a non Mercator projection.

Having "read" the preceding document "Construction of an EMI (interface)" clearly express's the construction and designs of the EMI device itself, curfice to say the device is cylindrical, and when projected into its Cartesian format the cylindrical values are transferred to the x and y surfaces of the "rectangular" Cartesian surface resulting in 0 to 360 degrees being displayed along the "x" axis or left to right with "0" being the midpoint of the axis or [0,0,0] of itself, and the "y" axis forms the proportional length indices of the physical dimension of the EMI; placing the "Azimuth, Angle incidence and the center of the EMI at a point located in the middle of the Cartesian surface.

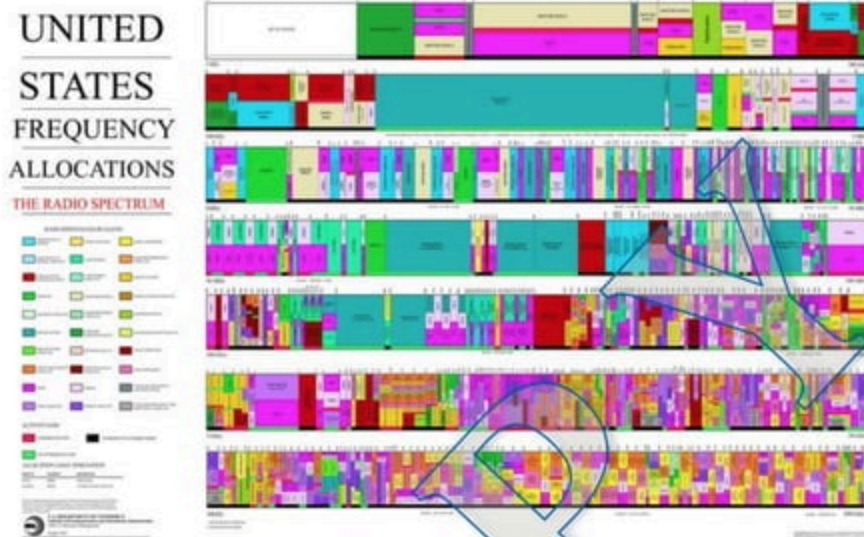

The "length" and of physical dimension of the EMI perform the calculation of " $F=1/T$ " the speed time constant resulting in an individual frequency that is directly proportional to the physical length of the EMI 80 mm or 8 Cm wave length, or 3.7 GHz (slap band in the middle of the Military block assignment).

3 GHz

Nigel

A better view of the "allocation" of "GLOBAL" frequencies comes from the document below:

When one considers the Cartesian surface pictorial representation of a 3.7 GHz (nominal Zero) EM emission of a circular polarized beam of EM lased energy that is highly directional, versatile and transportable, that creates an EM pulse of immense power, this power should never be in the hands of [ANY] Military, nor should it be kept a "private" secret for the benefit of the few, as was quoted, the needs of the many will always out weight the needs of the few.

Though its power output is phenomenal in comparison to anything mankind has known to date, there arises a more fundamental condition that of "time" itself, as expressed above, time resides at [0,0,0] of the x/y condition of the Cartesian display; that must exist else time itself fails the speed time constant, though to now consider the EMI construct itself is a "tube", an electron goes in (with a time) and comes out (with a time) where the tube length is the time differential itself; the Electron travels through the tube under a field of compression of infinite length based around it own rotational axis (outwards to inwards on a secondary rotational spin of it self), thus to re-represent time as the proportional state of the length of the tube would create a pictorial display not to dissimilar to diagonal line's where the inter section of the x,y co-ordinate relates to the angular decent in time; thus time CANNOT remain constant at the co-ordinate of [0,0,0] but resides in a proportional vectored condition of the constraint of the opposed compression of an elongated

Nigel

ellipsoid of the orbital path of an electron that is now "phasing" in and out to its own position in time; thus confirming time as a variable, and likewise space; when placing time as a variable, that of one unit of GPU or N1 of 1/1 of Hydrogen creates the subordinate condition that of fact that time is a compressible unit based on the ellipsoidal condition constrained by the EMI; and the now proved condition that of the fact of "space" being the moving part of the equation results in: "That time is a compressible "variable" now residing on a non existent constant"! Thus time [IS] compressible to an infinite proportion of 1/1 or N1 of 1/1 where time resides a derivative of a condition of a length of a compression of an ellipsoidal orbital path that is residing within the confines of an EMI, which is directly linked at the atomic level to the cosmic EM field a conditional of 1 to infinity where the infinitive condition that resides at the EMI co-ordinates of [0,0,0] thus enforcing and compels mankind to investigate the truth of the miss representation of the "Great Works" of one Mr. Albert Einstein.
